Amendments to th Specification

Page 16, replace the single paragraph of the Abstract of the Disclosure with the following paragraph:--

A shuttered connector according to the present invention includes a fitting part that receives a mating connector including an insertion part having a slanted surface, an insulator, at least one shutter that is rotatably supported by and fixed on the insulator, and helical springs that continuously urge the shutter in the closing direction. shutter is selectively in a closed state when the shutter covers the fitting part and in an opened state when the mating connector is capable of being fitted with the shuttered connector. The mating connector includes insertion parks. shutter further includes a guide units. The insertion parts. and the guide units cooperate to rotate the sharter in order to open the shutter so that the matching connector is capable of being fitted with the shuttered numbector having an inclined surface, the shuller being rotated to open outward, with the inclined surface being pushed by the slanted surface when the filling part receives the mating connector so that the shuttered connector is capable of fitting the mating connector
